DCS Logic Simulator v3.2.2 release report

Release date: 2026-11-10. Previous Stable: 3.2.1 (2026-11-10). Last Beta: 3.2.2-beta.1.

What is new

- The Stable web page now runs the simulation in the background engine (Worker), the same engine used in every full live test. If the Worker fails, the page engine takes over by itself and a message shows on the screen.
- The apk, the Windows exe and a local copy of the html keep the page engine until they are tested on a device.
- Nothing else changed from 3.2.1.

How it was tested

- Live check of Stable 3.2.1 on the web page with the Worker turned on: header, start screen, Cold load, faceplate, Details, Engineer, no errors.
- Automatic, on the 3.2.2 release build: regression tests 11 of 11; switches 438 cases, 0 wrong; logic blocks 51 sheets, 12021 checks, 0 wrong, plant model off and on; screen audit 27 screens, 0 page errors. Checks and Simulation tests pass on 3.2.2-beta.1.

Not tested live

- The Stable web page itself with the Worker as the default: it can be seen only after this release; a live check follows at once.
- Everything listed under Not tested live in the v3.2.1 report.

Known small items

- A faceplate moves up a little a few seconds after it opens.
- The items of the v3.2.1 report.
